

INSTA360 → FCP

Reframe & Export both ways

ONE CLIP · TWO EXPORTS
16:9 HORIZONTAL + 9:16 VERTICAL
THEN CUT IN FINAL CUT PRO

1

Import LOCAL MEDIA

- Keep **.insv pairs and all chunks together** in one folder — Studio stitches them. Same date+time prefix = one recording.
- .Irv** files are camera proxies. Fine for previewing, never the export source.
- "Some footage cannot be found" = a clip moved since last open. Put it back or re-import.

2

Scrub & find the shot

- Drag the **white dot on the yellow bar** under the preview — it spans the whole clip, so small drags jump far.
- Timeline too tight? Hit the **= magnifier** (bottom right) so the full clip fits, then drag the playhead.
- No fast-forward playback exists — dragging is the move.

3

Reframe VIDEO PANEL

- Zoom out:** drag the FOV number (top-left value) up, or tap a View Angle preset — **ULTRA** / **MEGA** for wide.
- Level it:** drag the preview to fix tilt (pitch) and direction (yaw). A big negative pitch = staring at the water.
- Moving subject:** set a keyframe, move the playhead, re-aim, set again. Or hit **Deep Track** and let it follow.

FRAMING RULE · face in, shoreline & pond out.

4

Pick the aspect BEFORE EXPORT

- Tap the **16:9** icon under the preview and choose **16:9** or **9:16**.
- Reframe each one separately.** A vertical crop needs a different aim and FOV than the horizontal — don't reuse the same keyframes.
- Export horizontal first, switch to 9:16, re-aim, export again. Two files, one clip.

5

Export × 2

- Export as: Video** (not 360 Video — that's the unreframed sphere).
- Name them so FCP tells them apart: **..._H.mp4** and **..._V.mp4**.
- Path → the external edit drive, in the day's folder.
- Check the Resolution box — it's the proof of which aspect you're in.
- Expect ~5–6 GB per 12 min at 4K. Normal.

16:9 HORIZONTAL

Preset **4K**
Resolution **3840 × 2160**
Frame rate **Match source (59.94)**
Codec **H.265**
Bitrate **Recommend (~50–60)**
Dolby Vision **off**

YouTube · Whatnot replay · widescreen cuts

9:16 VERTICAL

Preset **4K**
Resolution **2160 × 3840**
Frame rate **Match source (59.94)**
Codec **H.265**
Bitrate **Recommend (~50–60)**
Dolby Vision **off**

TikTok · Reels · Shorts — if it reads 3840 × 2160 you're still in 16:9

6

Final Cut Pro

- One project per aspect.** Horizontal: 3840×2160. Vertical: Custom 2160×3840. Frame rate = match the export.
- Cut first, polish second.** Make all your editorial cuts on the long clip, then tweak per shot — far less keyframing.
- Import both files → Spatial Conform **Fill** so the clip fills the frame with no bars.
- Need to punch in? 4K gives you room — stay under ~120% scale on a 1080/1920 delivery and it still looks clean.

ZOOMED WAY IN?

FOV in the 40s means a tiny slice of the sphere. Push it past 100° and re-aim.

SLUGGISH TIMELINE?

Export H.264 instead of H.265 — same look, snappier scrubbing in FCP.

WRONG ASPECT EXPORTED?

Don't crop in FCP. Go back to Studio, switch to 9:16, export again.

CHUNKS MISSING?

Never separate the numbered .insv pieces. Studio needs every chunk to build the master.
